## 论文摘要

### **Is gold a safe haven or a hedge for Chinese overseas investors?**

Gold is usually considered a hedge and a safe haven against stock market risk and currency risk. There is a scarcity of studies addressing the effectiveness of gold in scenarios where investors confront multiple risks simultaneously. Also, few studies investigate the properties of gold products traded in CNY, especially during and after Covid-19. Our study empirically investigates the hedge and safe haven properties of gold products traded in CNY against market risks in multiple stock markets and currency risks. Furthermore, the study provides investment advice for Chinese overseas investors who confront both market and currency risks.

### **Skilled labor migration: Job location choices of college graduates**

In this paper, we conduct a comprehensive study to evaluate the effectiveness of China's Talent Policies in attracting college graduates and identify the factors influencing their job location choices. We apply the Difference-in-Differences (DID) model to investigate the overall policy effect and the Random Coefficients Logit (RCL) model to explore policy effects on different types of students. The major policy implication of our paper is that the government needs to implement more cost-effective strategies and focus on regional economic and educational development to attract talented and skilled labor.

### **A model of coexistence of auctions with buyout options and posted-price sales: Evidence from eBay**

This study analyzes the equilibriums in two types of eBay auctions coexisting with posted-price sales: auctions with permanent and temporary buyout options. The equilibrium is further validated by simulations and empirical analysis using eBay iPhone auction data. Moreover, the study investigates the factors influencing sellers' decisions between posted-price sales and auctions.
